

## Some Information about the course 'Mobil Computing and Security Testing' during the BaSoTi

During this course you will learn the basics of ethical hacking. We will do some practical hacking exercises where you should get access to a prepared wireless network. In this network you will find an IT-System and you should get some information about the structure of the network and the IT-System.

For doing the exercises you need to do some preparations on your notebooks in forehand. Please install 'VirtualBox' as a virtualization system on your notebook so that you are able to install a virtual machine. For the hacking exercise you need to install Kali Linux, a Linux distribution that includes a lot of useful tool for hacking exercises. Please find some information about VirtualBox and Kali Linux here:
